Independent audit of data extraction: addendum (SUSTAIN-8 sample sizes)

Systematic review and meta-analysis: DXA-measured lean and fat mass differences with incretin-based therapy versus comparators (BMC Endocrine Disorders, submission 69e5b6d9; PROSPERO CRD420261323497). Authors: Birkan Alaycı, Öykü Zeynep Gerçek.

I confirm that I checked the SUSTAIN-8 sample sizes listed in Audit_addendum_SUSTAIN-8_sample_sizes.xlsx (the DXA analysis set of 178 participants, 88 semaglutide and 90 canagliflozin; the 114 participants with an observed end-of-treatment scan, 53 and 61; and the analysis population of the confirmatory analysis) directly against McCrimmon et al., Diabetologia 2020, that I was not involved in the original data extraction or analysis, and that my findings are recorded in the auditor columns of that file. This addendum supplements my statement of 27 September 2026.
